

Ethernet® Connectivity Products

Dove Computer Corporation designed its FastNet products to help you take advantage of the speed, security, and broad accessibility of Ethernet networking. The FastNet family includes Ethernet adapters and intelligent controllers that support Macintosh® computers. FastNet provides the Ethernet connection from Macintosh computers to a variety of systems, such as other Macintosh computers, DEC®, Sun®, Prime®, UNIX®-based, and IBM®PC®. FastNet supports AlisaTalk™, DECnet™, EtherTalk™, PacerShare®, TOPS®, TCP/IP, and other protocols.

High-performance networking demands high-performance connections that can support the complex applications used by today's professional and the advanced Macintosh user. FastNet Ethernet products let you communicate at the high speeds required for Local Area Networks (LANs). Dove's FastNet products provide you with a simple and trouble-free Ethernet connection.

FastNet adapters launch you onto Ethernet and give you access to a myriad of networking protocols. With FastNet SE_N, FastNet LAN 020, FastNet SE/30s and FastNet III_N, you get unequaled system flexibility without sacrificing the "user-friendliness" for which Macintosh is known. Joining supported software with the FastNet adapters lets you control network file transfers, file access, program launching, terminal emulation, and task-to-task transactions through the manipulation of desktop icons.

At Dove Computer Corporation, we are dedicated to providing you with the highest quality of networking products available for the Macintosh computer family. We guarantee it. Customer service and technical support come with every Dove product. A dedicated effort between Dove, OEMs, and systems integrators will help you realize the potential of your networking options.

FastNet®

FastNet SCSI is a desktop model, intelligent Ethernet controller that lets any SCSI port-equipped Macintosh computer communicate over the LAN. It supports a variety of networking protocols and includes installer software, a SCSI connection cable, and an Ethernet/Cheapernet transceiver.

FastNet SE_N is an Ethernet adapter that lets the Macintosh SE communicate over the LAN. It supports a variety of networking protocols and includes installer software and an Ethernet/Cheapernet transceiver.

FastNet LAN 020 is an accelerator and Ethernet adapter in one card. Dove combined its 16-MHz 68020 accelerator with its Ethernet adapter for the Macintosh SE on one multifunction board. FastNet LAN 020 options allow for a 68881 or 68882 math coprocessor and additional RAM. It includes installer software and an Ethernet/Cheapernet transceiver.

FastNet SE/30s is an Ethernet adapter for the Macintosh SE/30. Like all of Dove's FastNet products, it supports a variety of networking protocols and includes installer software and an Ethernet/Cheapernet transceiver.

FastNet III_N is an Ethernet adapter that lets the Macintosh II-series computer communicate over the LAN. It supports a variety of networking protocols and is equipped with an onboard Ethernet/Cheapernet transceiver.

Dove Computer Corporation also offers two standard IEEE 802.3 Ethernet connections.

DB15 for Ethernet (10Base5)
BNC for Cheapernet (10Base2)
